Protecting Lives • Protecting Property •
Protecting the Future

Ponderosa Pine (*Pinus ponderosa*)

Ponderosa Pine is native to northwest and north central Nebraska. Needles are grouped in threes and sometimes pairs 5-10" long. Cones are 3-6" long, each scale is armed with a sharp recurved spine. It can withstand prolonged drought and is the best pine to use on severe sites. Best used in east and south inside rows of windbreaks.

Hackberry (*Celtis occidentalis*)

Hackberry is a native tree and found throughout Nebraska. It has medium to long life span. Leaves are elm shaped; the grayish bark has a warty appearance. Once established, moderate rate of growth and tolerance to adverse weather can be expected. Can be used in single row windbreaks to slow summer winds and increase the snow catch over fields during winter.

Small Acreage Package For Western Nebraska

For landowners that want to plant trees, but don't want 25 of one kind.

Rocky Mountain Juniper (*Juniperus scopulorum*)

Rocky Mountain Juniper prefers slightly alkaline soils, but also grows well in rocky, sandy, or clay soils. Medium-sized tree, ranges from 15 - 25' in height. It is drought resistant. Maintains a bluish-green color throughout the winter. Provides both food and protective cover for wildlife.

Sand Cherry (*Prunus besseyi*)

Sandcherry is a low-growing shrub native to western Nebraska. It has showy white flowers in May and produces small, sweet, purplish-black cherries in July. Sandcherry can tolerate hot, dry conditions, and prefers well-drained soils. Cherries are especially good for making jelly or jam.

Gambel Oak (*Quercus gambelii*)

A deciduous small tree or large shrub. Provides dense groves or thickets and produces acorns for wildlife. Although Gambel oak wood is hard and dense, its branches are irregular and crooked, making them flexible enough to bend without breaking. It flourishes in full sun and is drought tolerant.
